No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

US2 or its soluble variants, can be used to reduce inappropriate immune responses. The US2 protein can be used to improve the persistence of a virus. Vectors encoding soluble US2 protein (residues 28-143) can be used to treat autoimmune disease, especially where it is mediated by MHC II molecules. The vector can also be used to improve gene therapy, and preferably also contains a sequence encoding a therapeutic product. The protein is exogenously supplied or expressed from a recombinant cell, and may also be used to inhibit CD4-positive mediated immune responses, transplant immune responses and gene therapy
                                                               US2; hCMV; major histocompatibility complex; MHC; class I; class II; antigen presentation; inhibition; CD8-positive; CD4-positive; T cell; transplant; gene therapy; immunosuppressive.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human cytomegalovirus (hCMV) US2 protein, which has previously been shown to block the major histocompatibility complex (MHC) class I antigen presentation pathway, blocks the MHC class II pathway. The US2 protein does not have to be mutated to cause inhibition of the MHC class II pathway. The binding domain recognizes MHC I heavy chains, MHC II alpha chains, and optionally DM-alpha chains. US2 has a double inhibitory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Inhibiting recognition of cellular tissue by CD8+ and CD4+ T cells, treat or prevent autoimmune diseases, and to improve gene therapy, comprises introducing human cytomegalovirus US2 protein into cells

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This is the human cytomegalovirus (hCMV) US2 protein, which has created by been shown to block the major histocompatibility complex (MHC) class I antigen presentation pathway, blocks the MHC class II pathway. The US2 protein does not have to be mutated to cause inhibition of the MHC class II pathway. The binding domain recognizes MHC I heavy chains, and optionally DM-alpha chains. US2 has a double inhibitory effect on the MHC class II pathway, inhibiting recognition of cellular tissue by CD8-positive and CD4-positive T cells. US2 or its soluble variants, can be used to reduce inappropriate immune responses. The US2 protein can be used to improve the persistence of a virus. Vectors encoding soluble US2 protein (residues 28-143) can be used to treat autoimmune disease, especially where it is mediated by MHC II molecules. The vector can also be used to improve gene therapy, and preferably also contains a sequence encoding a therapeutic product. The protein is exogenously supplied or expressed from a recombinant cell, and may also be used to inhibit CD4-positive mediated immune responses, transplant immune responses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          membrane, integral membrane, transmembrane, monotopic or polytopic membrane, pump, channel, receptor kinase, G protein-coupled receptor, or transporter protein, or membrane-associated enzyme, or Myc tag-EB tag-human m2 mAChR, flag tag-human beta2 adrenergic receptor-EE tag, human neurokinin 3 receptor-HSV tag-Myc tag, flag tag-human m1 mAChR-EB tag, and rat m3 mAChR-HSV tag-OctaHis tag. The ligand identified by the method of the invention is useful for the development of novel medicines and medicinal diagnostics. The present sequence represents the hydrophobic protein mellitin tag tag-Human beta2-adrenergic receptor EE used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention relates to a novel method for identifying a ligand for hydrophobic protein. The method comprises selecting a ligand molecule affinity selection by exposing a hydrophobic target protein bound by amphiphile to a multiplicity of molecules to promote formation of at least a complex between the hydrophobic target protein and the ligand

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       cc amphiphile to a multiplicity of molecules to promote formation of at cleast a complex between the hydrophobic target protein and the ligand cc molecule, separating the complex from the unbound molecules, and cc identifying the ligand molecule. The method of the invention is cusful for identifying a ligand for hydrophobic protein such as a cmembrane, integral membrane, transmembrane, monotopic or polytopic cc membrane, pump, channel, receptor kinase, G protein-coupled receptor, cc or transporter protein, or membrane-associated enzyme, or Myc tag-EE cc tag-human m2 mAChR, flag tag-human beata adrenergic receptor-EE tag, cc tag-human neurokinin 3 receptor-HSV tag-Myc tag-flag tag-human m1 mAChR-EE tag, and rat m3 mAChR-HSV tag-OctaHis tag. The ligand identified by the method of the invention is useful for the development of novel cc medicines and medicinal diagnostics. The present sequence represents hydrophobic protein mellitin-flag @Tag-human m1 mAChR-EE used in the cc method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches

The method comprises selecting a ligand molecule by affinity selection by exposing a hydrophobic target protein bound by an affinity selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection of at a selection

                                                                                                                                                                                                                                                                                                        of the present invention which describes human telomerase reverse transcriptase (hTRT). The present invention also describes the following methods: (A) determining whether a test compound is a modulator of hTRT, by detecting the change in hTRT recombinant protein or polymucleotide, on administration of the compound; the protein or polymucleotide, on administration of the compound; (C) preparation of frecombinant telomerase by contacting a protein preparation of hTRT with a telomerase RNA component; (C) detection of the hTRT RNA or protein in a sample by binding a relevant probe to the sample and detecting the complex formed or in the case of the hTRT RNA or protein in a sample by binding a relevant or protein complex or amplification product with presence of hTRT in the sample; and (D) increasing the product and correlating the presence of the propersion; and (E) the use of an agent that causes an increase in cell vertebrate cell proliferation to create a medicament that inhibits ageing. A protein preparation of hTRT and the polymucleotide encoding the fraction of ageing or cancer. Inhibitors of telomerase activity can be used to treat conditions that are associated with high telomerase.

                                                                                                    Ś
                                                                                                                                                                                                                                                                This invention describes a novel vascular endothelial growth factor-X (VEGF-X) protein (Ia) and its encoding polynucleotide (IIa) which has vilnerary, cytostatic, and its encoding polynucleotide (IIa) which has antinerary, cytostatic, antirheumatic, antiarthritic, antipsoriatic and cartifiabetic activity and acts as an angiogenesis and vascularization regulator. An antisense molecule of the invention is useful for treating corporating cancer, rheumatoid arthritis, psoriasis and diabetic retinopathy by inhibiting angiogenic activity or inappropriate eascularization including formation and proliferation of new blood vessels, growth and development of tissues, tissue regeneration and organ and tissue repair in a subject. The products further invention are useful for preparing medicaments for treating wounds such as dermal ulcers, pressure sores, venous sores, diabetic ulcers and burns and to promote skin graft growth, tissue repair, proliferation of new blood vessels, tissue regeneration and organ repair by promoting angiogenic activity or vascularization. This sequence represents a human VEGF-X protein which is can be expressed in Baculovirus/insect cell systems and which is

                                                                                                                                                                                                                                                                 This invention describes a novel vascular endothelial growth factor-X (VZGF-X) protein (Ia) and its encoding polynucleotide (IIa) which has vulnerary, cytostatic, antirheumatic, antiarthritic, antipsoriatic and antidiabetic activity and acts as an angiogenesis and vascularization regulator. An antisense molecule of the invention is useful for treating or preventing cancer, rheumatoid arthritis, psoriasis and diabetic retinopathy by inhibiting angiogenic activity or inappropriate rescularization including formation and proliferation of new blood vessels, growth and development of tissues, tissue regeneration and organ and tissue repair in a subject. The products of the invention are useful for preparing medicaments for treating wounds such as dermal ulcers, pressure sores, venous sores, diabetic ulcers and burns and to promote this result are treating to the invention are useful as the content of the content of the content of the content of the products of the invention are useful for preparing medicaments for treating wounds such as dermal ulcers, and burns and to promote the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   antirheumatic; antiarthritic; antipsoriatic; antidiabetic; treatment; angiogenesis regulator; vascularization regulator; cancer; psoriasis; rheumatoid arthritis; disabetic retinopathy; blood vessel; organ repair; tissue regeneration; tissue repair; wound; dermal ulcer; pressure sore; venous sore; diabetic ulcer; burns; skin graft growth.
                                                                                                      Sequence
                                                                                                                                                                       skin graft growth, tissue repair, proliferation of new blood vessels, tissue regeneration and organ repair by promobing angiogenic activity or vascularization. This sequence represents a human VEGF-X protein which can be expressed in E. coli systems and which is described in the method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Disclosure; Fig
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New vascular endothelial growth factor protein, useful for treating or preventing diseases associated with inappropriate angiogenesis activity such as cancer, rheumatoid arthritis, psoriasis and wounds -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          N-PSDB;

N-PSDB;
                                                                                                                                                      The present invention relates to vaccine for prevention and/or prophylaxis of infectious salmon anaemia in fish. The invention prophylaxis of infectious sequence encoding viral proteins of infectious salmon anaemia virus (ISAV) as well as the isolated protein. Nucleic acids encoding viral protein is useful for the manufacture of a DNA vaccine for diagnosis, treatment and/or prophylaxis of infectious salmon anaemia in fish, and viral protein can be used for the manufacture of antibodies that are specific for ISAV. The present sequence is infectious salmon anaemia virus 9Z-M fusion protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                         Claim 7; Page 39-41; 43pp; English
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               anemia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel vaccine for treatment and/or prevention of infectious salmon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Biering E,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         07-JAN-2000;

                                                                                                                                                                                                                                                                                                              This invention relates to a novel method for identifying a ligand for a hydrophobic protein. The method comprises selecting a ligand molecule by affinity selection by exposing a hydrophobic target protein bound by an amphiphile to a multiplicity of molecules to promote formation of at least a complex between the hydrophobic target protein and the ligand molecule, separating the complex from the unbound molecules, and identifying the ligand molecule. The method of the invention is useful for identifying a ligand for hydrophobic protein such as a membrane, integral membrane, transmembrane, monotopic or polytopic membrane, pump, channel, receptor kinase, G protein-coupled receptor, or transporter protein, or membrane-associated enzyme, or Myc tag-EE tag-human meurokinin 3 receptor-HSV tag-Myc tag, flag tag-human beta2 addrenergic receptor-EE tag, and rat m3 mAChR-HSV tag-OctaHis tag. The ligand identified by the method of the invention is useful for the development of novel medicines and medicinal diagnostics. The present sequence represents the protein sequence of muscarinic acetylcholine receptor in a baculovirus expression vector used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Signal sequence; ligand identification; hydrophobic protein;

The active polypeptide has CC a molecular weight of 7000-17,000 Da (as measured by mass complementry), and is derived from ectoparasitic leeches, of order (Rhynchobdellida, of genus placobdella and especially of species P. papillifera. The polypeptide inhibits the alternate route of CC complement activation but has substantially no effect on complement activation but has substantially no effect on complement complement factor D and/or C3bBb complex. The active polypeptide is CC useful for manufacturing a medicament and inhibits one or more steps in the alternate pathway of complement activation. It is useful for treating or preventing conditions, such as haemodialysis and CC extra-arterial stents, rejection of transplanted organs or tissues active such as the presence of in-dwelling catheters and CC extra-arterial stents, rejection of transplanted organs or tissues of complement activation activations of tissues by reperfusion after an ischaemic period and other conditions associated with activation of complement, including anaphylaxis, associated with activation of alternate complement pathway in a cathetic activation of alternate complement pathway in a

The method comprises exposing an acceptor substrate for UGGT to a labelled donor in the presence of the test sample and UGGT. The method is useful for determining UGGT activity. In particular, the method is useful in glucosyltransferase assay and kinetics measurement for determining UGGT activity. UGGT is a soluble enzyme of the endoplasmic reticulum which catalyses the addition of a glucose residue onto asparagine-linked oligosaccharides, which are present on incorrectly folded glycoproteins. The present sequence is the honeybee melittin signal peptide. This sequence was used in the construction of an expression vector for rat UGGT (see AAF60732 and AAB72436).

The ligand identified by the method of the invention is useful for the development of novel medicines and medicinal diagnostics. The present sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention relates to a novel method for identifying a ligand for hydrophobic protein. The method comprises selecting a ligand molecule affinity selection by exposing a hydrophobic target protein bound by amphiphile to a multiplicity of molecules to promote formation of at least a complex between the hydrophobic target protein and the ligand molecule, separating the complex from the unbound molecules, and identifying the ligand molecule. The method of the invention is useful for identifying a ligand for hydrophobic protein such as a method of identifying a ligand for hydrophobic protein such as a method of the invention as a method of the invention as a method of the invention as a method of the invention as a method of the invention as a method of the invention as a method of the invention as a method of the invention as a method of the invention as a method of the invention as a method of the invention as a method of the invention as a method of the invention as a method of the invention as a method of the invention as a method of the invention as a method of the invention as a method of the invention as a method of the invention as a method of the invention as a method of the invention as a method of the invention as a method of the invention as a method of the invention as a method of the invention as a method of the invention as a method of the invention and the invention as a method of the invention as a method of the invention as a method of the invention as a method of the invention as a method of the invention as a method of the invention as a method of the invention as a method of the invention as a method of the invention as a method of the invention as a method of the invention as a method of the invention as a method of the invention as a method of the invention as a method of the invention as a method of the invention and the invention and the invention and the invention and the invention and the invention and the invention and the invention and the invention and the invention and the inventio

                                                                                                                                                                                                                                                                                                                                                                                                                                           δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The sequence represents the honeybee melittin signal sequence, used in the invention to maximise secretion of heterologous proteins from insect cells. The invention relates to a novel composition for altering a B-cell mediated pathology in a patient. The composition for altering can be recomposition for altering a B-cell composition comprising at least a portion of a variable region of heavy chain or light chain (VH or VL) linked to at least a portion of an immunoglobulin constant region, where VH or VL region is associated with a B cell clone from the patient having the B cell mediated pathology. The composition of the invention has cytostatic, immunosuppressive, composition of the invention has cytostatic, immunosuppressive, and antithyroid activity. The composition is a vaccine useful for altering a B cell mediated pathology. This includes B cell jymphoma e.g. non-Hodgkins lymphoma, refractory low grade or follicular B cell lymphoma, autoimmune disease e.g. multiple sclerosis, systemic lupus erythematosus, anti-Hu associated paraneoplastic neurological syndrome,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention relates to a method for altering a T cell mediated CC pathology in a parient, the method involves administering a composition comprising a chimaeric protein which comprises at least a portion of a CC comprising a chimaeric protein which comprises at least a portion of a CC vbeta or Valpha region of a T cell receptor (TCR), and at least a CC vbeta or Valpha region is associated with a particular TCR from a T cell from the CC valpha region is associated with a particular TCR from a T cell from the CC cytostatic, neuroprotective, antidiabetic, dermatological, CC cytostatic, neuroprotective, antidiabetic, dermatological, CC cytostatic, immunosuppressive, antidiabetic, dermatological, CC antithyroid activities. The composition of the invention is useful for CC altering a T cell mediated pathology in a patient, where the T cell composition of the invention is useful for CC mediated pathology is T cell lymphoma, or an autoimmune disease selected CC inflammatory bowel disease, myasthenia gravis, rheumatold arthritis, and CC thyroiditis. The present sequence represents the honeybee mellitin CC into maximise the secretion of heterologous proteins from transfected control maximise the secretion of heterologous proteins from transfected control maximise the secretion of heterologous proteins from transfected control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control c

    Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ..

Biochim. Biophys. Acta 1031:143-161(1990).

-i- FUNCTION: Main toxin of bee venom with strong hemolytic activity.

Integrates into cell membranes and has multiple effects, probably,
as a result of its interaction with negatively charged
phospholipids. It inhibits well known transport pumps such as the
Na(+)-K(+)-ATPase and the H(+)-K(+)-ATPase. Increases the
permeability of cell membranes to ions, particularly Na+ and
indirectly Ca(2+), because of the Na(+)-Ca(2+)-exchange.

-i- SUBCNIT: Momomer and homotetramer.

-i- SUBCNILULAR LOCATION: Secreted.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                HELIX

Toloning and sequencing of cDNA coding for prepromelittin of Polistes are "Cloning and sequencing of cDNA coding for prepromelittin of Polistes are "Cloning and sequencing of cDNA coding for prepromelittin of Polistes are "Cloning and sequencing of cDNA coding for prepromelittin of Polistes are better the property of the SWBL/GenBank/DDBJ databases.

Submitted (FEB-2002) to the SWBL/GenBank/DDBJ databases into cell code in the sequence of the code in the sequence of the code in the sequence of the probably, as a result of its continuous and has multiple effects, probably, as a result of its code interaction with negatively charged phospholipids. It inhibits well known transport pumps such as the Na(+)-K(+)-ATPase and the CC H(+)-K(+)-ATPase. Increases the permeability of cell membranes to ions, particularly Na+ and indirectly Ca(2+), because of the CC ions, particularly Na+ and indirectly Ca(2+), because of the SUBUNIT: Momomer and homotetramer (By similarity).

Integrates into cell membranes and has multiple effects, probably, as a result of its interaction with negatively charged phospholipids. It inhibits well known transport pumps such as the Na(+)-K(+)-ArPase and the H(+)-K(+)-ArPase. Increases the permeability of cell membranes to ions, particularly Na+ and indirectly Ca(2+), because of the Na(+)-Ca(2+)-exchange (By similarity). SUBCULTI. Momomer and homocetramer (By similarity). SUBCELLULAR LOCATION: Secreted (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       TISSUE SPECIFICITY: Expressed by the venom gland. SIMILARITY: BELONGS TO THE MELLITIN FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      PF01372; Melittin;

Schmid G., Englbrecht A., Schmid D.;

"Cloning and nucleotide sequence of a cyclodextrin glycosyltransferase gene from the alkalophilic Bacillus 1-1.";

(In) Huber O., Szejtli J. (eds.);

Proceedings of the fourth international symposium on cyclodextrins, pp.71-76, Kluwer Academic Publishers, Dordrecht and Boston (1988).

-1- CATALYTIC ACTIVITY: Degrades starch to cyclodextrins by formation of a 1,4-alpha-D-glucosidic bond.

-1- COFACTOR: BINDS TWO CALCIUM IONS.

-1- SUBUNIT: Monomer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              01-JUL-1993
